

Method And System For Determining Receipt Of A Delayed Cookie In A Client-Server Architecture

Abstract of Disclosure

In a client-server architecture, a semi-persistent connection between the client and the server allows delayed or asynchronous transmission of a cookie or token. Delayed or asynchronous transmission of the cookie allows initial web page generation and display while awaiting a slow cookie, such as a cryptographically generated cookie that might be used for single-session sign-on. A technique for determining whether the client has received the cookie is also provided.
